WA DNR: Time data created in postForms is overwritten when the form is loaded

For legacy data migration, I have been using the VisualVault postForms API method to create migrated data. Recently, the client noticed an inconsistency with the "time" value of a Calendar control that has time enabled and "Ignore Timezones" enabled. When I investigated this, I found that I was consistently setting the date and time to midnight UTC, but when I opened the form and saved it, the time data was being overwritten.

After discarding any specific configurations from this project affecting the field, I created a test harness (zzzJohnDevTest) where I configured a Calendar control that has time enabled and "Ignore Timezones" enabled ("test2"), and began creating form records using a microservice ("zzzJohnDevTestWebSvc") that set the field to a consistent ISO date string ("2026-03-01T13:00:00.000Z"), to see what may be occurring.

What I found was that on opening the created record and running VV.Form.GetFieldValue on the Calendar control, it consistently overwrote the time information, to what appeared to be some local time. Saving the form from that point committed the overwritten date information to the database and showed the new time in the form dashboards, in the database, and in the UI.

- It's also worth noting that any subsequent re-opening and saving of the form record do not change the time further.

This poses a significant challenge for many reasons. In the context of legacy data migration, it effectively erases an expected time on opening newly migrated legacy form records. Outside of that context, it introduces an unexpected mutation of any new time data that may be necessary for time-critical business processes.

I have attached a recording of my testing of this issue, and I have been able to replicate it consistently.

Error Details

- UTC DATE TIME: 2026/27/03 - 17:48
- UI MESSAGE: n/a
- CONSOLE ERROR: n/a

- STACK TRACE: n/a

Environment Details

- ENVIRONMENT: vv5dev
- CUSTOMER: WADNR
- DATABASE: fpOnline
- DEVICE: desktop
- OS: Windows
- BROWSER: Google Chrome

User Details

- USER ID: john.sevilla@visualvault.com
- USER GROUP: Any

Preconditions

- Have a VaultAccess account in the environment
- Have a view into the data within the Form Template/table zzzJohnDevTest (i.e. create a Form Dashboard or view in SSMS)

Steps to reproduce

Note: Many of these steps are drawn from the attached recording, please refer to the recording along with this writeup

1. From the form library, open a new instance of the "zzzJohnDevTest" form
2. Click on the "Test Local WebSvc" button, this will create a new instance of the "zzzJohnDevTest" form with the "test1" and "test2" fields populated (uses "zzzJohnDevTestWebSvc")
3. Using your view, locate the create form instance and observe the value in the "test2" field which should have some representation of "03/01/2026 01:00PM"
4. Open that form instance in the form viewer
5. In the developer console, run VV.Form.GetFieldValue on the "test2" field
6. Observe that the time on the control itself (UI) says "03/01/2026 01:00PM" but the value on the console shows a different time
7. Without making any additional modifications, run VV.Form.DoAjaxFormSave to save the changes
8. Close the form instance
9. Using your view, observe that the time has now shifted to the time previously shown on the console
10. Open the form instance once more
11. Observe that the time on the control (UI) has changed to the new time
12. In the developer console, run VV.Form.GetFieldValue on the "test2" field
13. Observe that the time in the console now matches the new time

Current behavior

Creating a form record and setting a date and time value on a field with a Calendar control that has time enabled and "Ignore Timezones" enabled via postForms will have its time value overwritten on opening the form in the form viewer

Expected behavior

Creating a form record and setting a date and time value on a field with a Calendar control that has time enabled and "Ignore Timezones" enabled via postForms will not have its time value overwritten on opening the form in the form viewer, allowing consistency between what is initially created and what is first seen/saved.

INITIAL RESPONSE SENT TO REQUESTER:

The product has also been set to GRMVVSupport for other actions later to be run as responses are made on this ticket.

The VisualVault support team has received your support request. A support representative will review and send a personal response via the support portal, where you can also respond and track the progress of this ticket.

Ticket #: *[#124697]*

Ticket Summary: WA DNR: Time data created in postForms is overwritten when the form is loaded

Thank you,

We will review this and reach back out with any questions/comments as soon as possible.

---

by **Mark Fronstin** on **Fri, 27 Mar at 12:20 PM** as **Outbound email**

Hello John,

Gentle reminder to send the Jira ticket number.

--

This response is in regards to support ticket [#124697].

If calling in or referencing this concern outside of this email chain, please provide the ticket ID. This will help us provide the fastest resolutions.

Hi John,

I was reviewing this with a member of the team. I did have a question as far the current implementation. For migrations, we've exposed a POST that used the FormsAPI application as opposed to the VisualVault core API endpoints. From the example it looks like the VV core API endpoint is being used.

If you end up changing to use the FormsAPI post, using the current date format will work. However, if you change the date format to `03/01/2026 13:00:00` then the current route would work based on some of the logic that is happening.

Let me know if you want to meet up at all to review.

Thanks,

Mike

by **John Sevilla** on **Thu, 2 Apr at 9:11 AM** as **Private note**

Hey Mike,

Thank you for the response. As you suggested, I updated zzzJohnDevTestWebsvc and attempted to create a form record using both methods with the date string `03/01/2026 13:00:00` .

When I used the **formtemplates/<formTemplateId>/forms** endpoint (the one you refer to as part of the "VisualVault core API endpoints"), I found that using the date string `03/01/2026 13:00:00` still resulted in the same unexpected behavior I originally reported, where the date is seemingly changed on the clientside (please refer to 0:30 of attached recording).

When I used the **forminstance/** endpoint (the one you refer to as part of the "FormsAPI application"), using the date string `03/01/2026 13:00:00` does retain the time on the clientside as expected (see 1:00 of attached recording).

The behavior of the **formtemplates/<formTemplateId>/forms** endpoint seems like an issue worth investigating because many scripts across the company's projects leverage the postForms method of the VV Node.js library, and this time shift on newly created records seems like it would result in several reported issues.

For my purposes, however, I believe I switching to the **forminstance/** endpoint is enough, since I need to create hundreds of thousands of records with consistent date information for legacy data migration. My issue should be resolved, but I defer to you in case you have any additional questions or guidance before closing this.

---

by **Karim Kargozar** on **Fri, 3 Apr at 1:11 PM** as **Private note**

Update from Karim 4/3 @ 2:00 PM PST: Discussion is in progress between Product Support and Project team. John has provided response and awaiting product team to reply to possibly close the issue.

---

by **Michael Betz** on **Tue, 7 Apr at 8:05 AM** as **Private note**

A solution was provided. John Sevilla had an additional concern that we are investigating but changing priority to Low given the current state.
